# Avoid

- Unnecessary comments
- Poorly named structures
- Huge classes
- Long methods
- Repetition

```
#region -- InitCountryDropdown Method --  
/// <summary>  
/// Summary description for CountryDropDownList.  
/// </summary>  
protected override void InitCountryDropdown(EventArgs e)  
{  
    if (Items.Count == 0)  
    {  
        this.DataSource = CountryTable();  
        this.DataTextField = "CountryName";  
  
        //CH 2012-4-5 - Adding separate data value field  
        //to fix bug #4535  
        //We're now storing the country ID instead  
        //of the country name if desired  
        if (useCountryName == true)  
        {  
            this.DataValueField = "CountryName";  
        }  
        else  
        {  
            this.DataValueField = "CountryID";  
        }  
  
        this.DataBind();  
        this.CssClass = "entryfield";  
    }  
}  
#endregion
```

```
protected override void InitCountryDropdown(EventArgs e)  
{  
    if (Items.Count > 0) return;  
  
    this.DataSource = CountryTable();  
    this.DataTextField = "CountryName";  
    this.DataValueField = useCountryName ? "CountryName" : "CountryID";  
    this.DataBind();  
    this.CssClass = "entryfield";  
}
```

**Goal: Density. More in each “eye full”**

# Naming

- Classes - nouns, single responsibility
- Methods - GetRegisteredUser, IsValidSubscription, ImportDocuments, SendEmail
- Avoid side effects for methods (it only checks, gets, delete, but not everything together)
- Booleans - isOpen, done, isActive, hasLoggedIn (is/are. have/has)
- Avoid using and, if, of in method name 
- Don't use abbreviations
- Be positive

```
List<decimal> p = new List<decimal>() {5.50m, 1.48m};  
decimal t = 0;  
foreach(var i in p)  
{  
    t += i;  
}  
return t;
```

(isLoggedIn vs isNotLoggedIn)

```
List<decimal> prices = new List<decimal>() {5.50m, 1.48m};  
decimal total = 0;  
foreach(var price in prices)  
{  
    total += price;  
}  
return total;
```

# Assign booleans implicitly, ternary operations

```
bool goingToChipotleForLunch;  
if (cashInWallet > 6.00)  
{  
    goingToChipotleForLunch = true;  
}  
else  
{  
    goingToChipotleForLunch = false;  
}
```

```
int registrationFee;  
if (isSpeaker)  
{  
    registrationFee = 0;  
}  
else  
{  
    registrationFee = 50;  
}
```

```
bool goingToChipotleForLunch = cashInWallet > 6.00;
```

```
int registrationFee = isSpeaker ? 0 : 50;
```

# Magic Numbers

```
if (age > 21)
{
    // body here
}
```

```
const int legalDrinkingAge = 21;

if (age > legalDrinkingAge)
{
    // body here
}
```

```
if (status == 2)
{
    // body here
}
```

```
if (status == Status.active)
{
    // body here
}
```

```
if (employeeType == "manager")
```

```
if (employee.type == EmployeeType.Manager)
```

## Intermediate Variables

❌ 

```
if (employee.Age > 55
    && employee.YearsEmployed > 10
    && employee.IsRetired == true)
{
    // body here
}
```

← What question is this asking?

✅ 

```
bool eligibleForPension = employee.Age > 55
    && employee.YearsEmployed > 10
    && employee.IsRetired == true;
```

## Encapsulate Complex Conditionals

❌ 

```
//Check for valid file extensions, confirm is admin or active
if ( (fileExt == ".mp4"
    || fileExt == ".mpg"
    || fileExt == ".avi")
    && (isAdmin == 1 || isActiveFile))
```

✅ 

```
private bool ValidFileRequest(string fileExtension, bool isActiveFile, bool isAdmin)
{
    var validFileExtensions = new List<string>() { "mp4", "mpg", "avi" };

    bool validFileType = validFileExtensions.Contains(fileExtension);
    bool userIsAllowedToViewFile = isActiveFile || isAdmin;

    return validFileType && userIsAllowedToViewFile;
}
```

## Encapsulate Complex Conditionals

❌ 

```
//Check for valid file extensions, confirm is admin or active
if ( (fileExt == ".mp4"
    || fileExt == ".mpg"
    || fileExt == ".avi")
    && (isAdmin == 1 || isActiveFile))
```

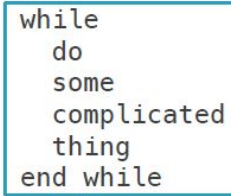

✅ 

```
private bool ValidFileRequest(string fileExtension, bool isActiveFile, bool isAdmin)
{
    return (fileExt == ".mp4"
        || fileExt == ".mpg"
        || fileExt == ".avi")
        && (isAdmin == 1 || isActiveFile))
}
```

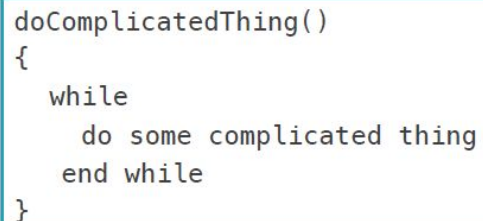

## Before

```
if
  if
    while
      do
        some
        complicated
        thing
      end while
    end if
  end if
```

## After

```
if
  if
    doComplicatedThing()
  end if
end if
```

```
doComplicatedThing()
{
  while
    do some complicated thing
  end while
}
```

```
// Good style
public class Order
{
    private readonly IRepository _repository;

    private readonly IPriceCalculator _priceCalculator;

    public Order(IRepository repository, IPriceCalculator priceCalculator)
    {
        _repository = repository;
        _priceCalculator = priceCalculator;
    }

    public CopyFrom(Order originalOrder)
    {
        // Create new order
    }

    public Cancel(Customer customer)
    {
        // Cancel order
    }
}
```

```
if (condition1)
{
    // block of code to be executed if condition1 is True
}
else if (condition2)
{
    // block of code to be executed if the condition1 is false and condition2 is True
}
else
{
    // block of code to be executed if the condition1 is false and condition2 is False
}
```

# .gitignore

[gitignore.io](https://gitignore.io)

# Do it yourself

- Create a new repository in [github.com](https://github.com)
- Add `.gitignore` ([gitignore.io](https://gitignore.io))
- Clone repository (under green button in github)
- Create a new branch from main
- Add some files to the branch (commit, push)
- Create a pull request to main
- Merge the new branch with main
- Pull (fetch) newest main
- Create a new branch from main

# Do it yourself - Merge conflict

- Create a branch from main
- Add changes to that branch (commit, push)
- Merge changes to main, but don't fetch the main branch
- Create another branch from main ( now it should be behind remote branch)
- Changes the same files, which you changed in the previous branch
- Push changes to the branch, merge with main
- Now there should be a merge conflict, because you changed the same files and when created a new branch, didn't fetch changes

## Git Cheat Sheet

### Git Basics

<code>git init</code> <code>&lt;directory&gt;</code>	Create empty Git repo in specified directory. Run with no arguments to initialize the current directory as a git repository.
<code>git clone &lt;repo&gt;</code>	Clone repo located at <code>&lt;repo&gt;</code> onto local machine. Original repo can be located on the local filesystem or on a remote machine via HTTP or SSH.
<code>git config</code> <code>user.name &lt;name&gt;</code>	Define author name to be used for all commits in current repo. Devs commonly use <code>--global</code> flag to set config options for current user.
<code>git add</code> <code>&lt;directory&gt;</code>	Stage all changes in <code>&lt;directory&gt;</code> for the next commit. Replace <code>&lt;directory&gt;</code> with a <code>&lt;file&gt;</code> to change a specific file.
<code>git commit -m</code> <code>"&lt;message&gt;"</code>	Commit the staged snapshot, but instead of launching a text editor, use <code>&lt;message&gt;</code> as the commit message.
<code>git status</code>	List which files are staged, unstaged, and untracked.
<code>git log</code>	Display the entire commit history using the default format. For customization see additional options.
<code>git diff</code>	Show unstaged changes between your index and working directory.

### Rewriting Git History

<code>git commit</code> <code>--amend</code>	Replace the last commit with the staged changes and last commit combined. Use with nothing staged to edit the last commit's message.
<code>git rebase &lt;base&gt;</code>	Rebase the current branch onto <code>&lt;base&gt;</code> . <code>&lt;base&gt;</code> can be a commit ID, a branch name, a tag, or a relative reference to HEAD.
<code>git reflog</code>	Show a log of changes to the local repository's HEAD. Add <code>--relative-date</code> flag to show date info or <code>--all</code> to show all refs.

### Git Branches

<code>git branch</code>	List all of the branches in your repo. Add a <code>&lt;branch&gt;</code> argument to create a new branch with the name <code>&lt;branch&gt;</code> .
<code>git checkout -b</code> <code>&lt;branch&gt;</code>	Create and check out a new branch named <code>&lt;branch&gt;</code> . Drop the <code>-b</code> flag to checkout an existing branch.
<code>git merge &lt;branch&gt;</code>	Merge <code>&lt;branch&gt;</code> into the current branch.

# Jautājumi

- Kāpēc ir vajadzīgs .gitignore?
- Kāpēc uzdevumus pilda atsevišķos branchos, nevis main branchā?
- Kas ir pull?
- Kāpēc vajag pullot main branchu un tad no tā taisīt jaunu branchu?
- Kāpēc rodas merge conflicts?
- Kāpēc jātaisa pull requests?
- Kas ir push?
- Ko dara commit?
- Kas ir stash?
- Kāda ir commit message vērtība?
- Kur var apskatīties brancha vēsturi?
- Kā var atcelt izmaiņas pēc tam, kad tā ir iepushotas?
- Kad taista PR, kur var redzēt kādi faili ir laboti?
- Kad var mergot PR?
